DETAILED ACTION

1. This office action is in response to the amendment filed June 14, 2004. Claims 1-18 are presented for examination.

Allowable Subject Matter

2. Claims 1-18 are allowed.
3. The following is an examiner's statement of reasons for allowance:

Independent claim 1 recites the following limitation, which is not shown by the prior art: **“reducing the weight of each terminal edge for each said identified node by the minimum weight of every terminal edge for said identified node”**. Similar limitations are presented in independent claims 8 and 13.

This limitation had previously been indicated as being taught by Ibe et al. (USPN 6,437,804) (hereinafter Ibe). Ibe teaches partitioning a network graph into multiple independent graphs, wherein the nodes denote switches in the network, and weights are defined for each node indicating the number of ports that node supports. This is a distinction from the claimed invention in that the weights are related to the nodes rather than the edges. Ibe goes on to teach reducing the weight of a heavy cluster of nodes by moving a node adjacent to a smaller cluster to balance the cluster weights. This is clearly distinct from the above limitation in question. An updated search was conducted to determine if any other prior art references were available that taught the reduction of edge weights in combination with generating a minimum cut solution of a partitioned graph, but none were found. Thus, the above limitation patentably distinguishes the claimed invention from the prior art.
